Inspiratron.org - Natural language processing, machine learning and cybersecurity

About

by Nikola Miloševi? - Friday, May 30, 2014

https://inspiratron.org/about/

Inspiratron was started in June 2012 as project of Nikola Miloševi? (myself). Web site was started as part of master thesys in School of Electrical Engineering, University of Belgrade, which topic was to create sentiment analysis tool for Serbian language. While building tool new idea emerged: to build a web site dedicated to my interests and work in field of natural language processing, machine learning and computer security. Now as I am PhD student at the University of Manchester in the field of text mining, idea extended to showcase research in the field, provide tools and some consultancy help to the interested people and organizations.

Name of web site, inspiratron, has to personify computer world (TRON) filled with inspiration (inspiration+tron=inspiratron).

Vision of this project is to build and make accessible some tools of natural language processing and machine learning by creating small web applications. Since development of machine learning algorithms is slow process, this site is still not complete and it's materials will grow in time.

If you need more information about myself you can take a look to my cirucullum vitae
